

# Robotic arm tracking palm

## 1. Introduction

The function of robotic arm tracking palm is to increase the function of controlling the movement of the robotic arm on the basis of the target positioning of the robotic arm palm. According to the coordinate position of the palm in the camera, the joint angle of the robotic arm is controlled in combination with the PID algorithm, so as to realize the function of the robotic arm tracking the palm.

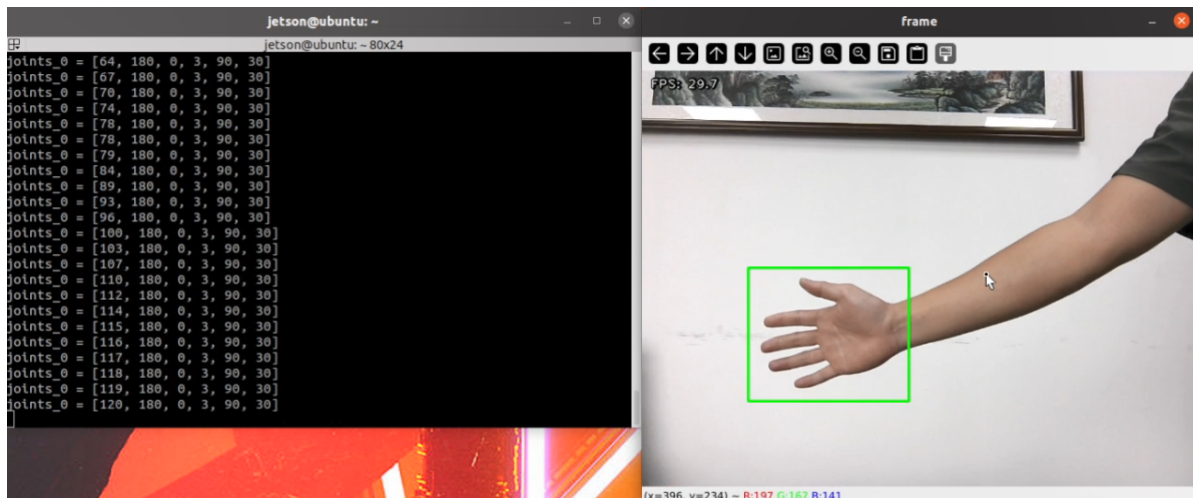

## 2. Startup

### 2.1. Preparation before starting the program

**Note that when the program is running, the range of motion of the robotic arm is relatively large, and there should be no other objects around the robotic arm to avoid being hit by the robotic arm.**

### 2.2. Program description

After the program is started, after the camera captures the image, the robotic arm will follow the movement of the palm in the picture. **Here the movement speed of the palm should not be too fast, otherwise the robotic arm cannot keep up.**

### 2.3. Program startup

- Enter the following command to start the program

```
roscore
roslaunch dofbot_hand Hand_Follow.py
```

Press q in the image or press Ctrl+c in the terminal to exit the program.

### 3. Source code

Code path:

```
~/dofbot_ws/src/dofbot_hand/scripts/Hand_Follow.py
```

```
